 Functions assign outputs to inputs. Some functions have simple rules, like "for every x, return x". However, there can be other rules that are more elaborate. For example, "If x<0, return 2x, and if x>0, return 3x." These are called "piecewise functions", because their rules aren't uniform, but consist of multiple pieces.

 $f(x) = \begin{cases} 0, & \text{if } x < 0 \\ 1, & \text{if } 0 \leq x < 2 \\ 2, & \text{if } x \geq 2 \end{cases}$ . Evaluate f (x) at x = -1, 0, 1, 2, and 3. Sketch the graph of the piecewise function f. Solution. Because each piece of the function in (6) is constant, evaluation of the function is pretty easy. You just have to select the correct piece.

**Answered: a piecewise linear function, find (a) - bartleby**  
 Let's see, if you, yeah, that is negative 66 over 11, which is equal to negative six. So when x is equal to 10, our function is equal to negative six. And so this one actually doesn't have any jumps in it. It could've, but we see, so there we have it. We have graphed this function that has been defined in a piecewise way.
