Bisphosphonates work by slowing down the cells which break down bone (osteoclasts). Therefore they slow down bone loss, allowing the bone building cells (osteoblasts) to work more effectively. They can help to strengthen bone and help to prevent it getting any weaker. People who take a bisphosphonate are less likely to break (fracture) a bone.

Bisphosphonates | How do bisphosphonates work? | Patient

There is a very good balance between the rates of bone breakdown and growth, which keeps bones strong and healthy. What bisphosphonates do. Bisphosphonates are drugs that target areas of higher bone turnover. The osteoclast cells, which break down old bone, absorb the bisphosphonate drug. Their activity is slowed down. This reduces bone breakdown.
