Parasites. Parasites are part of a large group of organisms called eukaryotes. Parasites are different from bacteria or viruses because their cells share many features with human cells including a defined nucleus. Parasites are usually larger than bacteria, although some environmentally resistant forms are nearly as small.

Some of these bacteria can be harmful to human health. Drinking water with disease-causing bacteria, viruses, or parasites (collectively called pathogens) can make you sick. It is not practical to test drinking water for every type of pathogen, but it is simple to test drinking water for coliform bacteria. The presence of coliform bacteria can indicate there may be harmful pathogens in the water.

A parasitic presence can be diagnosed through a fecal exam or a blood test. In especially aggressive cases, X-rays or MRIs may be able to identify parasites in the body. Depending on the nature of the parasite, antibiotics or other medication may be used to treat the infection. Unfortunately, some parasites have no treatment.
