In all these endeavors the main focus is the understanding that the process of transmission of an infectious disease is nonlinear (not necessarily linear) and dynamical in character. This concept compels the appropriate quantification of the vital parameters that govern these dynamics.

Incarcerated populations experience elevated burdens of infectious diseases, which are exacerbated by limited access to prevention measures. Dynamic models are used to assess the spread and control of diseases within correctional facilities and repercussions on the general population. Our systematic review of dynamic models of infectious diseases within correctional settings identified 34 studies published between 1996 and 2017.

models of epidemics have facilitated fundamental insights into the dynamics and control of infectious diseases (Box 16.2), while more complicated models, which usually require numerical analysis, have also played an important role in advancing the understanding of epidemics. Other key attributes of compartmental models are that they are easy to communicate and to replicate or modify by others, as they can be written down as a series of equations ...

As implied by the variable function of t , the model is dynamic in that the numbers in each compartment may fluctuate over time. The importance of this dynamic aspect is most obvious in an endemic disease with a short infectious period, such as measles in the UK prior to the introduction of a vaccine in 1968.
