These early primates resembled present-day prosimians such as lemurs. Evolutionary changes continued in these early primates, with larger brains and eyes, and smaller muzzles being the trend. By the end of the Eocene Epoch, many of the early prosimian species went extinct due either to cooler temperatures or competition from the first monkeys.

They must also determine whether the fossils are from recent or ancient organisms. If a skull were discovered and determined to be a large primate skull, the next step would be to determine whether it is of an ape or a human. Because evolutionary change has occurred in both groups, the skull could be of . early or modern ape. or . early or modern human

Evolutionary Changes in Primates

The primate fossil record is relatively poor, and our understanding of primate evolution (especially human evolution) changes as new information comes to light. Knowledge of primate evolution is derived through the use of fossils and biochemical methods. Fossils allow us to understand the relationships between modern and extinct primates.

Because evolutionary change has occurred in both groups, the skull could be of early or modern ape or early or modern human. Because humans and apes evolved along separate lines, certain physical characteristics can be used in an attempt to classify the fossil skull as belonging to either ape (early or modern), early human, or modern human.
