In this book Professor Sternberg of Harvard University takes a fairly detailed look at the deep links between mathematical group theory and the underpinnings of much of modern physics. It's heavy going in many parts, requiring at least an undergraduate degree in mathematics (one containing lots of group theory) to even vaguely follow it.

Shlomo Sternberg - Wikipedia

A group is called Abelian¹ if the operation is
commutative: $g i g j = g j g i$. Obviously the center of
an Abelian group is the group itself. The symmetry
group C_4 of the square is Abelian; the analogous group
of the cube is an example of a non – Abelian group. In
physics we often deal with groups (or subgroups of)
 $GL(n,F)$.
