It introduces the concept of performance-based design (PBD). It also addresses serviceability considerations, prediction of tall building motions, damping devices, seismic isolation, blast-resistant design, and progressive collapse. The final chapters explain gravity and lateral systems for steel, concrete, and composite buildings.

Bungale S. Taranath. Tall buildings have a unique appeal, even an air of romance and mystery associated with their design. The adoration that super- and ultratall buildings command lies in their apparent freedom from gravity loads—they do not just stand tall, they seem to do so effortlessly resisting gravity as well as laterally directed force generated by wind gusts and seismic ground motions.
