The geohelminths together present an enormous infection burden on humanity. Those which cause the most disease in humans are divided into three main groupings, Ascaris lumbricoides (the large roundworm), Trichuris trichiura (whipworm), and the blood-feeding hookworms (Ancylostoma duodenale and Necator americanus), and this book concentrates on these.

researchers, students and scholars who enjoy reading excellent research on problems of global significance. This volume focuses mainly on the geohelminths - *Ascaris lumbricoides*, *Trichuris trichiura* and the hookworms (*Ancylostoma duodenale* and *Necator americanus*). The book is intended to supplement more formal texts that cover their taxonomy, life cycles, morphology,...

of its lifecycle occurs in soil. Ova require warm, moist soil to embryonate into infective larvae.

In ideal settings, *Ascaris* ova can persist for over 14 years.

Therefore, this parasite flourishes in tropical areas where year-round transmission is possible.

The soil-transmitted helminths are a group of intestinal parasites belonging to the phylum Nematoda that are transmitted primarily through contaminated soil. They are so called because they have a direct life cycle which requires no intermediate hosts or vectors, and the parasitic infection occurs through faecal contamination of soil, foodstuffs and water supplies. The adult forms are essentially parasites of humans, causing soil-transmitted helminthiasis, but also infect domesticated mammals. T

The two geohelminths, *Ascaris lumbricoides* and *Trichuris trichiura*, infect more than a billion people worldwide but are only reported sporadically in the developed part of the world. In contrast, the closely related species *A. suum* and *T. suis* in pigs have a truly global distribution, with infected pigs found in most production systems.

Assessing the zoonotic potential of *Ascaris suum* and ...

Soil-transmitted helminths (STH), also known as geohelminths [1, 2], are "intestinal worms infecting
